## Multiple Layers for Better Filtration

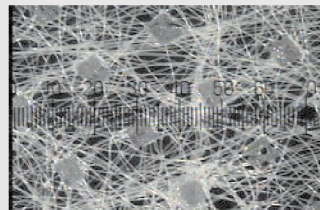

- Multiple layers of spunbond polypropylene and hydroentangled polyester
- Great flexibility and application
- Good Capacity/Strength
- Low Cost

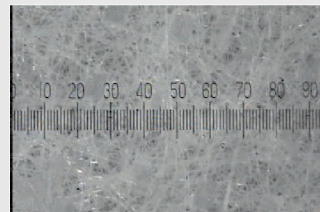

*Ultrasonically bonding multiple layers of spunbond polypropylene as the outer layers with the middle layer being hydroentangled polyester. This composite improves capacity and flexibility in many metal working fluids. The weight possibilities with HTM are endless. This media would be an excellent selection for small, medium, and large grinding.*

HTM25  
2.5 oz/sq. yd.

*Consume less filter media with layered HTM. Filter cycles are often twice that of standard filter media.*

Layered HTM is made by sandwiching multiple layers of thin spunbond materials as seen above around a lofty polyester middle layer.
